About Yulu

Yulu is India's leading micro-mobility service provider, which offers unique vehicles for the daily commute. Starting off as a mission to eliminate traffic congestion in India, Yulu provides the safest commute solution through a user-friendly mobile app to enable shared, solo and sustainable commuting.

Yulu zones are located at all the appropriate locations (including metro stations, bus stands, office spaces, residential areas, corporate offices, etc) to make those first and last miles smooth, affordable, and convenient!

Yulu has recently suffered considerable dips in its revenues. They have contracted a consulting company to understand the factors on which the demand for these shared electric cycles depends. Specifically, they want to understand the factors affecting the demand for these shared electric cycles in the Indian market.

Business Problem

The company wants to know:

- Which variables are significant in predicting the demand for shared electric cycles in the Indian market?
- How well those variables describe the electric cycle demands

Dataset

Column Name	Description
datetime	datetime
season	season (1: spring, 2: summer, 3: fall, 4: winter)
holiday	whether day is a holiday or not (extracted from DC Government Holiday Schedule)
workingday	if day is neither weekend nor holiday is 1, otherwise is 0.
weather	1: Clear, Few clouds, partly cloudy, partly cloudy 2: Mist + Cloudy, Mist + Broken clouds, Mist + Few clouds, Mist 3: Light Snow, Light Rain + Thunderstorm + Scattered clouds, Light Rain + Scattered clouds 4: Heavy Rain + Ice Pallets + Thunderstorm + Mist, Snow + Fog
temp	temperature in Celsius
atemp	feeling temperature in Celsius
humidity	humidity
windspeed	wind speed
casual	count of casual users
registered	count of registered users
count	count of total rental bikes including both casual and registered

Outlier Detection

```
In []: colors = dict(boxes='lightblue', whiskers='dimgrey', medians='dimgrey', caps='dimgrey')
    df.plot(kind='box', subplots=True, layout=(3, 4), sharex=False, figsize=(12, 18), patch_artist=True, color=colors);
    plt.suptitle("Outliers", y=0.92, fontsize=14);
```

Outliers

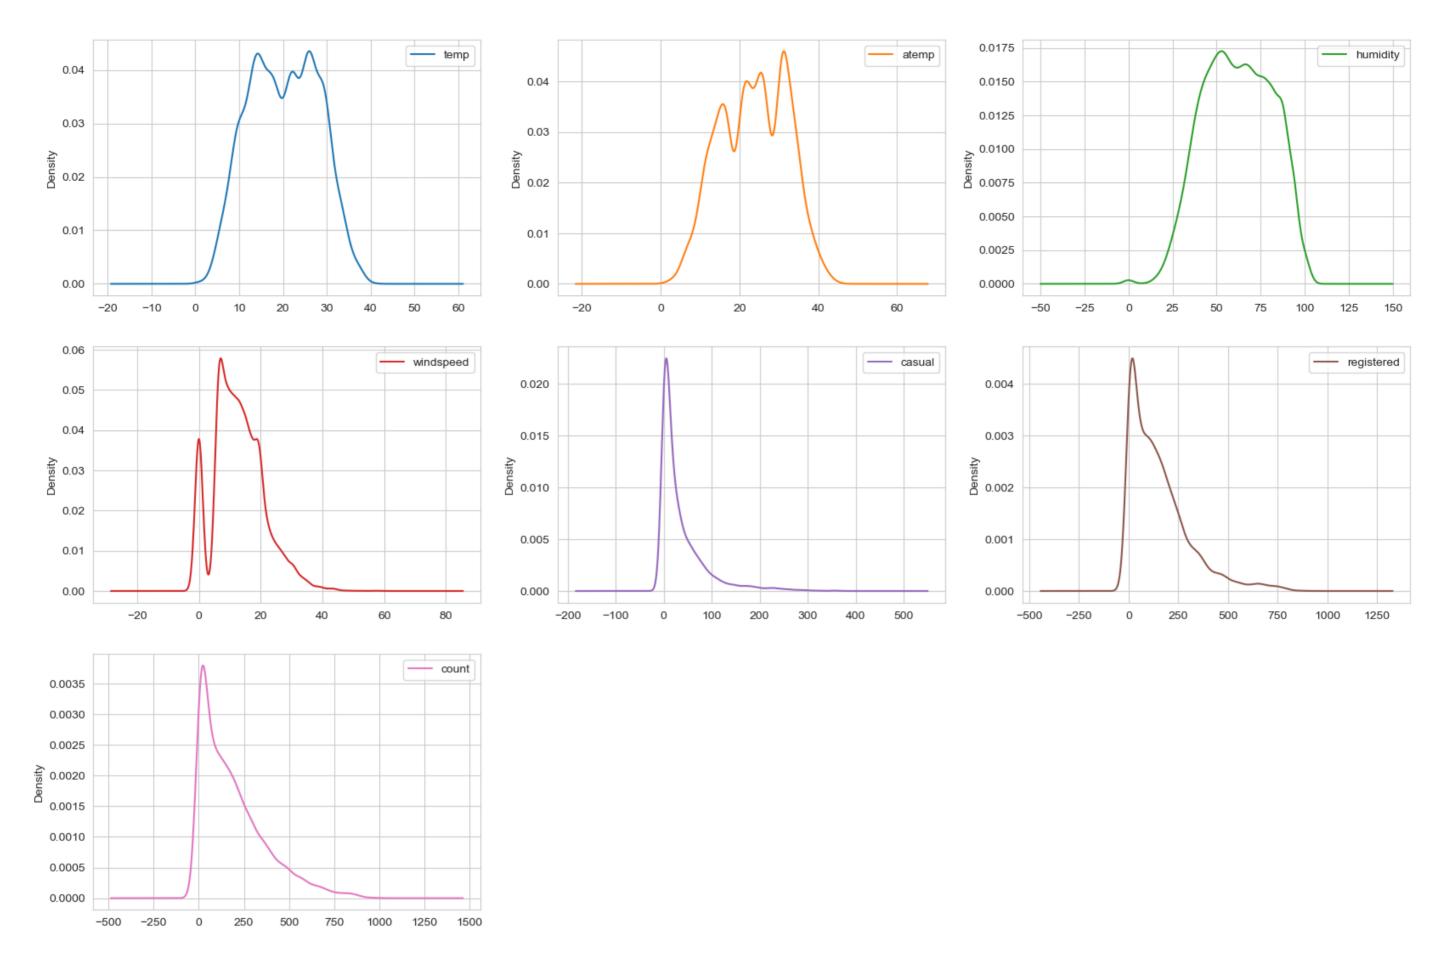

Observations

- There are lot of outliers in the dataset for casual, registered, count and windspeed.
- We will not remove this as this will result in loss of data.

Checking Distributions

```
In []: df.drop(["date"], axis=1).plot(kind='kde', subplots=True, layout=(4, 3), sharex=False, figsize=(20, 18), sharey=False);
plt.suptitle("Density Plot", y=0.92, fontsize=14);
```

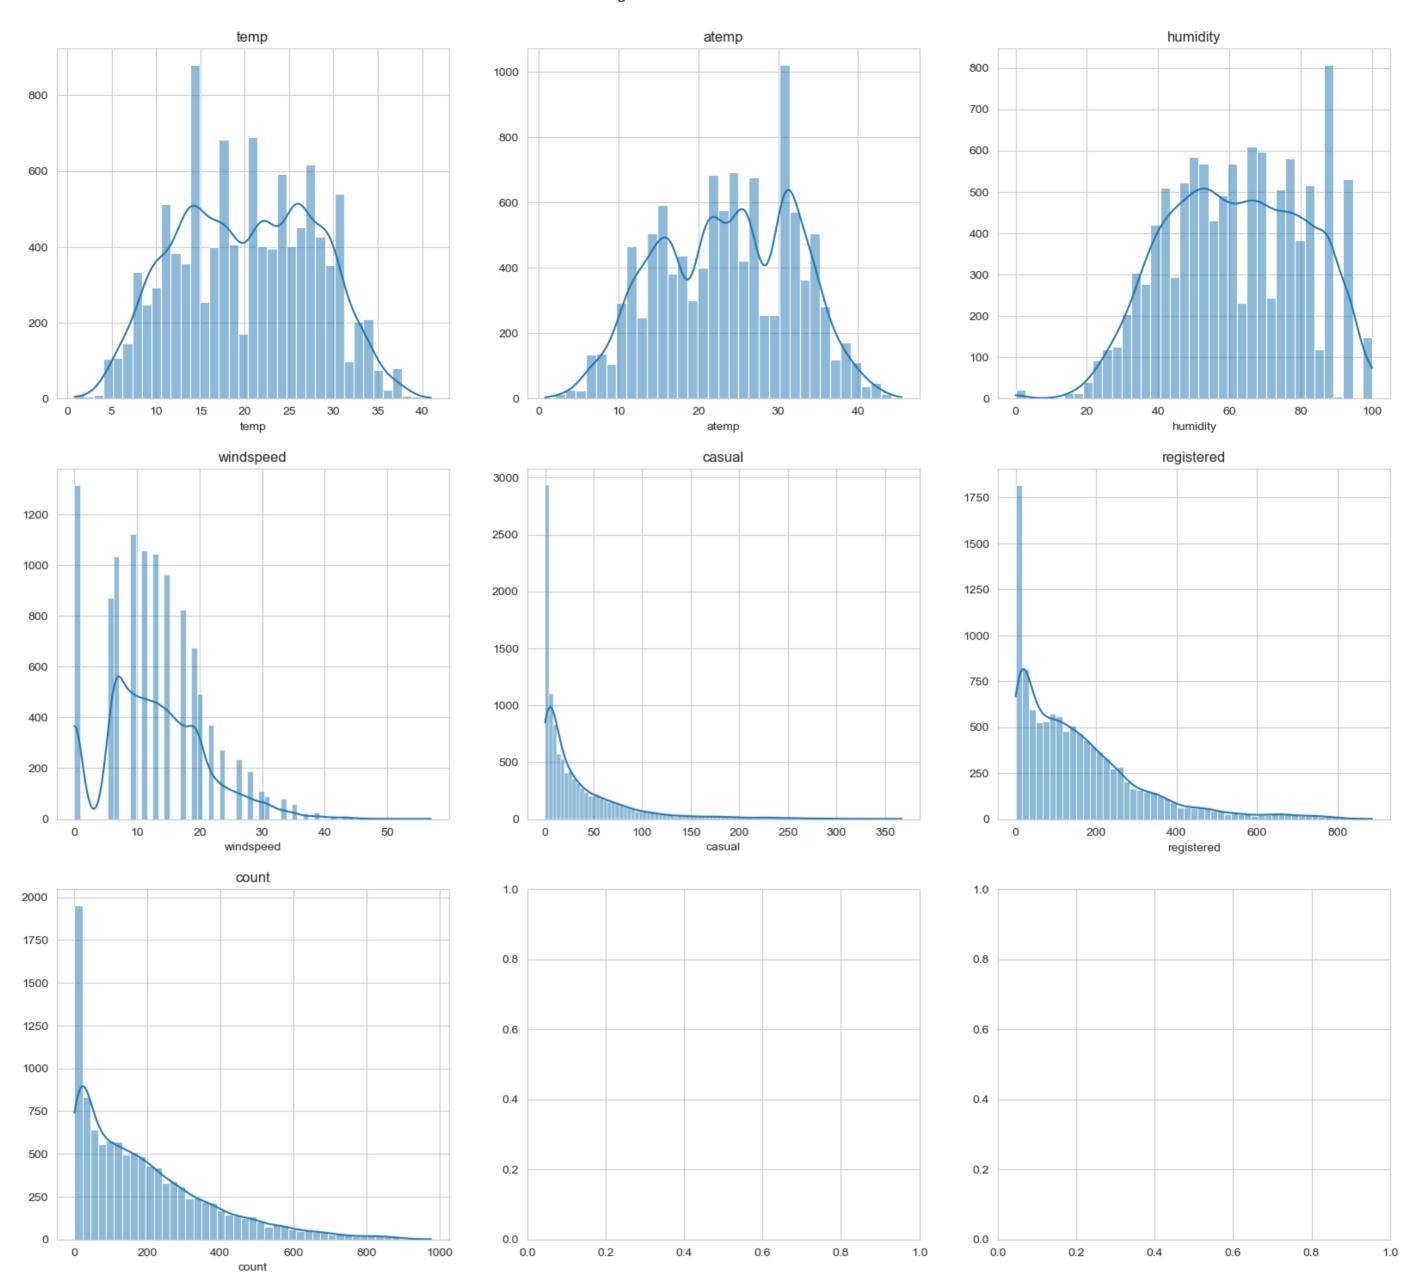

• Above charts show the dessity plots of the numerical columns

```
In []: numerical_columns=[ 'temp','atemp','humidity', 'windspeed', 'casual', 'registered', 'count']
In []: fig, axes = plt.subplots(nrows=3, ncols=3, figsize=(20, 18), sharex=False, sharey=False)
for col, ax in zip(numerical_columns, axes.flatten()):
    sns.histplot(df[col], kde=True, ax=ax)
    ax.set_title(col)
    ax.set_ylabel('')

plt.suptitle("Histogram of Feature Distribution", y=0.92, fontsize=14)
plt.show();
```

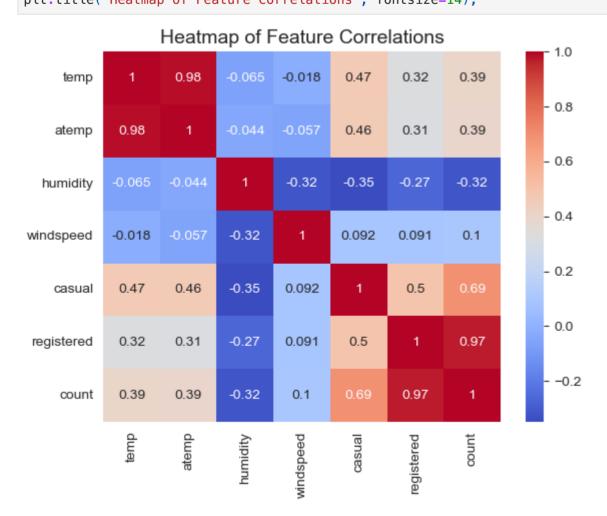

Histogram of Feature Distribution

Observations

- Casual, Registered and Count column does not appear to be normally distributed
- Windspeed, Count, Registered and Casual columns are not normally distributed

In []: sns.heatmap(df[numerical_columns].corr(), annot=True, cmap='coolwarm')
 plt.title("Heatmap of Feature Correlations", fontsize=14);

Observations

- We can see that "atemp" is highly correlated with "temp". We can drop the "atemp" column.
- We can see that casual and registered count are highly corelated, but will not be dropping to prevent loss of data.

In []: df=df.drop(["atemp"], axis=1)

In []: # df["log_count"] = np.log1p(df["count"])
df["log_casual"] = np.log1p(df["casual"])
df["log_registered"] = np.log1p(df["registered"])

```

Observations

Month

- We can see that demand is high throughout June, July, August, September and October.
- Demand starts increasing after from February onwards.

Season

- We can see that during Fall season, high demand was observed
- Summer and Winter seasons had equal demand

Spring season had the lowest demand

Weather

- Highest demand was observed during clear weather.
- The demand decreased as the condition of the weather decreased.

Weekday

- All days of the week have similar demand.
- On weekends there is increased number of casual users as compared to other days.

Working Day

• Demand is higher on a working day.

Time of Day

- Evening time has the highest demand.
- Morning and afternoon time have medium demand.
- Night and Late Night has the lowest demand.

Temperature

- There is highest demand during warm(21 30 degrees celsius) and cool(11-20 degree celsius) temperatures.
- The demand decreases as the temperature increases above 30 degrees celsius.
- The demand decreases as the temperature deceases below 10 degrees celsius.

Humidity

- There is higher demand during medium to high humidity conditions.
- There is low demand during low humidity conditions.

Wind Speed

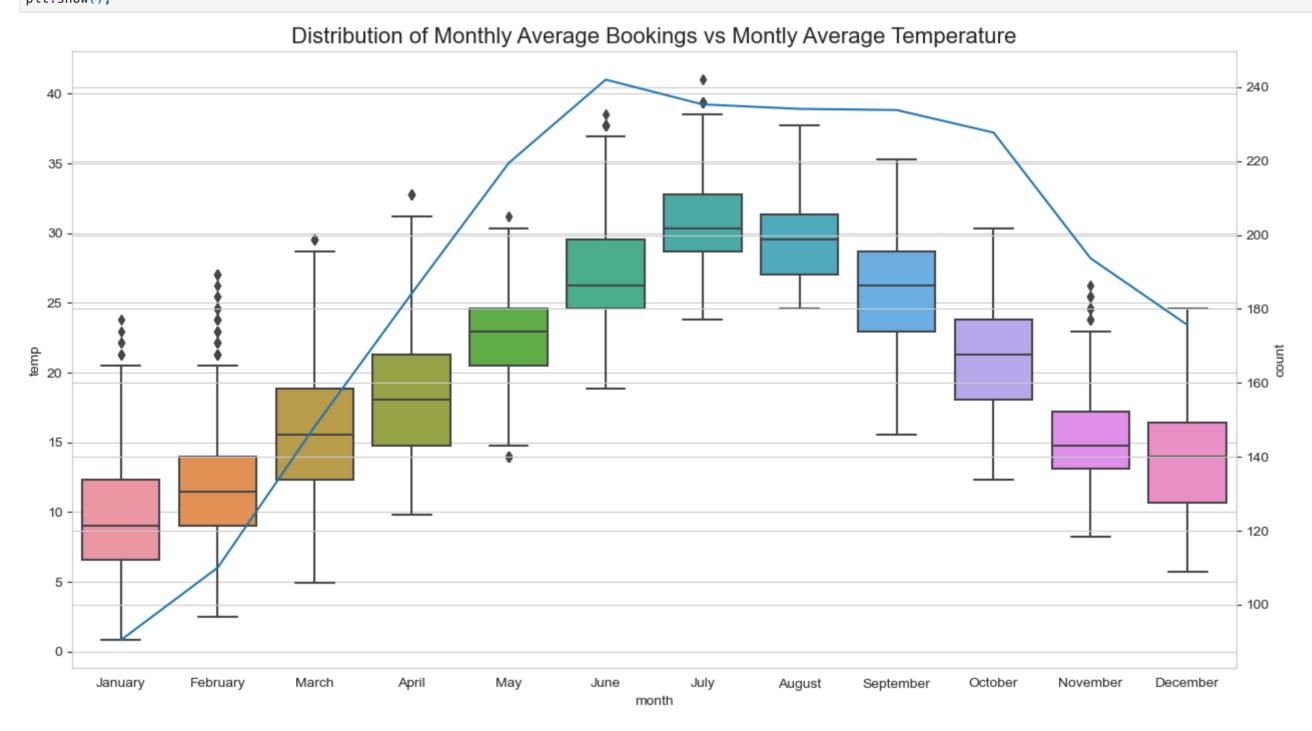

- There is high demand during gentle breeze and moderate breeze
- There is low demand during strong breeze and moderate gale.

Comparing Count with Numeric Variables

```
In []: monthly_grouped_df=df[["month","count"]].groupby("month",sort=False).mean().reset_index()

In []: fig, ax1 = plt.subplots(figsize=(15, 8))

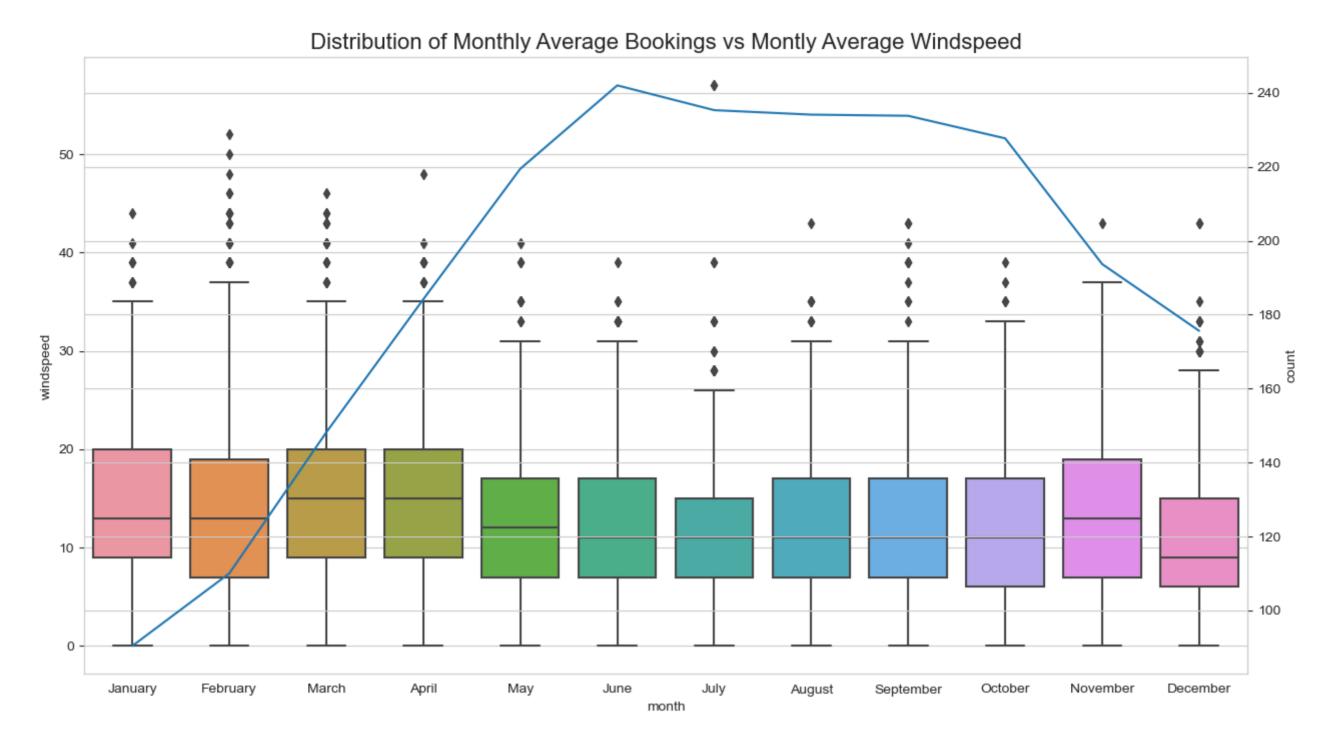

sns.boxplot(x="month", y="temp", data=df, ax=ax1, order=df['month'].cat.categories)
    ax2 = ax1.twinx()
    sns.lineplot(x="month", y="count", data=monthly_grouped_df, ax=ax2, sort=False)
    plt.title("Distribution of Monthly Average Bookings vs Montly Average Temperature", fontsize=16);
    plt.show();
```

Observations

• From above plot we can see that demand increases as the temperature increases and demand decreases as the temperature decreases.

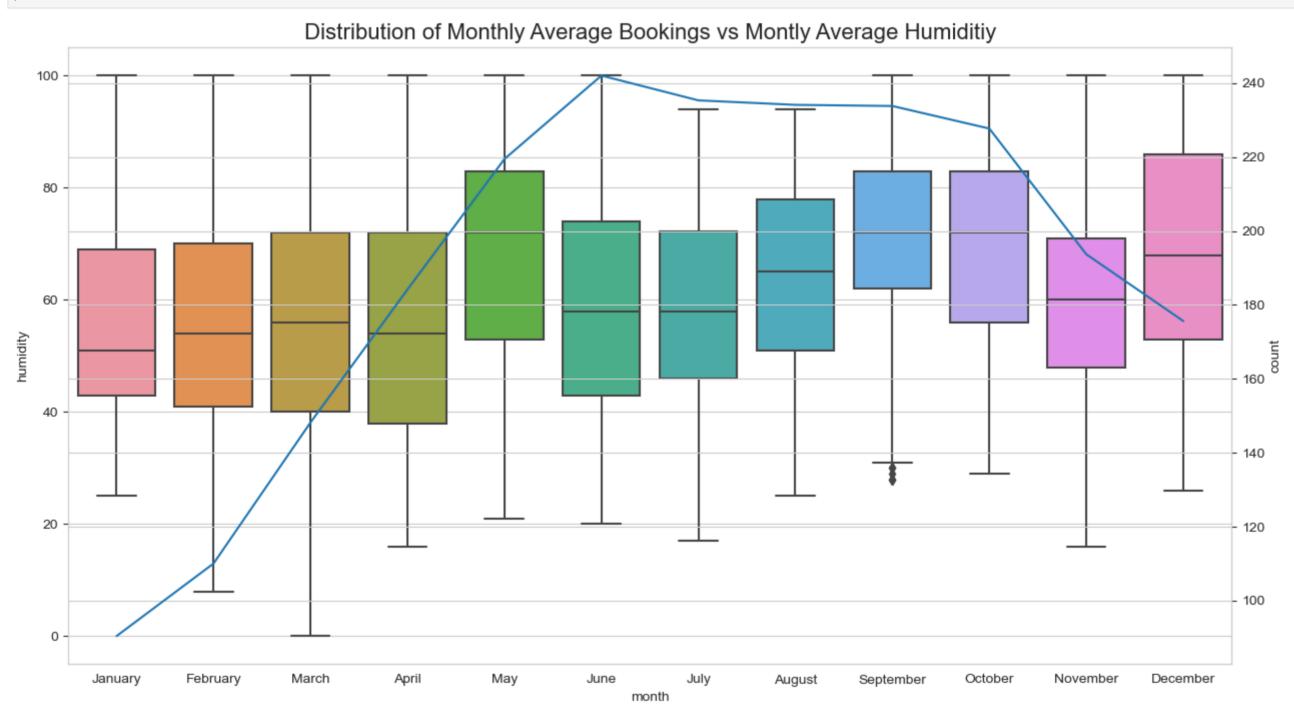

```
In []: fig, ax1 = plt.subplots(figsize=(15, 8))
sns.boxplot(x="month", y="windspeed", data=df, ax=ax1, order=df['month'].cat.categories)
ax2 = ax1.twinx()
sns.lineplot(x="month", y="count", data=monthly_grouped_df, ax=ax2, sort=False)
plt.title("Distribution of Monthly Average Bookings vs Montly Average Windspeed", fontsize=16);
plt.show();
```

Observations

• From above plot we can say that windspeed is not a contributing factor to demand.

```
In []: fig, ax1 = plt.subplots(figsize=(15, 8))
sns.boxplot(x="month", y="humidity", data=df, ax=ax1, order=df['month'].cat.categories)
ax2 = ax1.twinx()
sns.lineplot(x="month", y="count", data=monthly_grouped_df, ax=ax2, sort=False)
plt.title("Distribution of Monthly Average Bookings vs Montly Average Humiditiy", fontsize=16);
plt.show();
```

Observations

• From above plot we can say that humidity is not a contributing factor of demand.

Hypothesis Testing

We will set the significance level to 0.05

Weather vs Season

- Ho: Weather and Season are independent.
- Ha: Weather and Season are not independent.

```

Insights

- We can see that p value is very small. Hence we reject the null hypothesis.
- We can say that demand is dependent on different weather conditions.

Recommendation and Insights

- Working Day or Holiday does not contribute to demand changes.
- There appears to be increased number of casual users on weekends.
- We can conclude that Weather and Season is a major contributor for changes in demand.
 - Clear weather has the highest demand.
 - Light rain or snow has the lowest demand.
 - Fall, Summer and Winter Season has the higher demand.
 - Spring Season has the lowest demand.
- Humidity is not a contributing factor for changes in demand.
- Temperature is a major contributor for changes in demand.
 - As the temperature increases, the demand increases
 - Warm temperature(20-30 degrees Celsius) has the highest demand.
- Wind speed is minor contributor for changes in demand.
 - Demand decreases as the wind speed increases.
- Time of the day is a minor contributor for changes in demand.
 - Evening has the highest demand followed by Morning which is then followed by Afternoon.
- Yulu can convert weekend casual users to registered users by offering discount if they sign up during the weekends.
- Yulu can use above data to decrease or increase the amount of cycles deployed on the roads. This can decrease the maintenance cost and any other operational costs.
- On larger scale, Yulu can decrease the number of cycles deployed on the roads during Spring season and increase the number of cycles deployed on the roads during Summer, Fall and Winter season.
